JKlubTV

Version 4.0.56-beta

Manage chess round robin tournaments with JKlubTV

This application will capture the round-robin tournament belonging data into a SQLite database. It is intended for webmasters who want to easily manage a club tournament in their own chess club. The HTML tables that are to be published for the website will be created easily by the application. Automatically calculating the total points Sonneborn Berger points of each player, as well as their sequence DWZ, and sorts the HTML table by the calculated ranking. It is also possible the tables to save as a PDF file. The software is free (opensource).

Instructions:

1. **create / load database:** Create a new database (menu item: new database) or load an existing database (menu: load database).

2. ## Add players:

   When you create a new database, it is easier first players in the player list (menu item: Player List) entered and then the tournaments with the corresponding groups of the tournament list (menu item: the list of tournaments) to create. You can download the player from the database of the German Chess Federation DWZ query (menu item: Players list) -> (menu item: DSB database). You need the ZPS number of their association. They are available at the

web address: http://www.schachbund.de/verein.html.

3. **Create tournament:** Click the (menu item: list of tournaments) and then create a new tournament with (menu item: new tournament).

Known bugs in the program:

1. **Demolition of a player during a tournament:** Exact arrangements for termination of a player still has to be implemented

If you discover errors in the program, I would be grateful if you can send me describe these errors and send an email so I can fix the error can hopefully.
